Spravochnik po obrabotke tsvetnykh metallov i splavov (Handbook on the
Processing of Nonferrous Metals and Alloys) Moscow, Metalurgizdat,
1951. 872 p. Errata slip inserted. 9,300 copies printed.

Ed. (Title page): L. Ye. Miller, Candidate of Technical Sciences; Ed. of
Publishing House: K. D. Misharina; Tech. Ed.: M. K. Attopovich.

PURPOSE: This handbook is intended for technical personnel of metal-
working and machine-building plants, design organizations, scientific
research institutes, and laboratories, and for students at schools of
higher technical education.

COVERAGE: The handbook discusses the physicochemical and mechanical
properties of certain elements and the composition and properties of

Card 1/8

Handbook on the Processing (Cont.)

SOV/3500

nonferrous metals and alloys, and includes an explanation of the theory of principal methods for the hot and cold working of nonferrous metals and alloys. Reference material on designing, engineering,-economic planning, quality control, and other aspects of production is systematized and presented. Each part of the handbook contains explanations of principles underlying basic processes, presents formulas for process and engineering calculations, analyzes properties of metals and alloys, gives parameters of accompanying and secondary processes, and describes equipment and tools and their operational parameters. The authors think I. L. Perlin, Ya. F. Shabashov, and M. F. Bazhenov. References accompany each part, as well as various chapters. There are 130 references, mostly Soviet.

TITLE: Dynamic characteristics of the electro-hydraulic controller with hydraulic drive AGP-1

SOURCE: AN SSSR. Institut avtomatiki i telemekhaniki. Pnevmavtomatika (Pneumatic automation). Moscow, Izd-vo Nauka, 1966, 116-122

TOPIC TAGS: hydraulic device, hydraulic equipment, electrohydraulic controller, automatic control theory

ABSTRACT: The authors describe a new electro-hydraulic controller which incorporates an electromechanical converter, a two-stage hydraulic amplifier with needle and follower valves, a hydraulic prime mover, a feedback mechanism, and a number of auxiliary systems. The block diagram of the control system is shown in Figure 1. The input signal U_i is fed into the measuring unit 1, amplified and demodulated in the ac amplifier-demodulator 2, then compared to the dc feedback signal at the summing junction. The dc error signal is amplified in 3 and used to drive the electromechanical converter 4 (based on electromagnets). This converter in turn actuates hydraulic amplifier 5, which drives hydraulic prime mover 6. The feedback loop consists of feedback transduc-

er 7, and RC network 8. The controller can be operated in derivative, integrating, and derivative-integrating modes. The configuration of the feedback loop determines the mode of operation. The transfer functions for each mode of operation are derived and the performance is analyzed. Test results are plotted for various values of components. Orig. art. has: 5 figures, 26 formulas.

TITLE:

Determination of the Thickness of Electrodeposits by Measuring
the Thermoelectric Force (Opredeleniye toshestviny
galivanicheskogo pokrytiya metala i izmereniya termoelektropo-
dvizhushchey sily)

PERIODICAL:

Friberostroyeniye, 1959, Kr 1, pp 24-25 (USSR)

ABSTRACT:

The following method is employed: The thermoelectric force which forms between the metal of the underlayer and the metal of the electrodeposit on heating the latter is measured. When being pressed against the electrodeposit the heated end of the transducer will heat the electrodeposit. The higher the layer of the electrodeposit the lower is the temperature at the point where electrodeposit and underlayer metal touch and the smaller is the thermoelectric force. The skeleton diagram and a photograph of the newly developed device are shown. The device can measure the thickness of nickel platings on brass and steel. The transducer is electrically heated and its temperature is measured by the means of a thermocouple which is connected with the galvanometer Kr 1. The underlayer on which the measuring object rests is also nickel. Since the transducer is also made

Card 1/2

Determination of the Thickness of
Electrodeposits by Measuring the Thermoelectric Force

SCV/113-53-1-17/20

of nickel no parasitic thermoelectric force is possible in the case of touching the electrodeposit. The thermoelectric force occurring in case of heating is measured with the galvanometer Nr 2 in compensate circuit. The indication of the device depends on the extent of pressure which is exercised by the transducer upon the electrodeposit and also on the temperature of the transducer. 100°C were chosen as permanent temperature of the transducer. A microammeter of the type M95 serves as galvanometer Nr 2. The pressure of 11. transducer on the electrodeposit is 1 kg. The transducer has a capacity of 30 W. As it is possible by means of this device to carry out measurement at different points of the electrodeposit a non-destructive testing of the quality of the electrodeposit is possible. There are 3 figures and 6 Soviet references.

"Study of the Blood Clotting Factors in Cyanotic Children With Congenital Heart Defect."

Budapest, Orvosi Hetilap, Vol 108, No 11, 12 Mar 67, pages 490-492.

Abstract: [Author's Hungarian summary] In the course of blood studies involving 28 children with congenital heart defect and cyanosis, lower than normal values were found: for the prothrombin complex activity in 60 per cent, for the prothrombin activity in 66 per cent, for the V factor activity in 45 per cent and for the VII factor activity in 66 per cent of the cases. The decrease in the activity of the coagulation-active constituents was found to be proportional to the elevation in the hematocrit value. The proportionality was closest in the case of factor VII and least close in the case of factor V. 3 Eastern European, 15 Western references.

AUTHORS: Goldschmidt, Rezsö, and Szabolcs, László

TITLE: Automatic voltage regulator for a device for removing extraneous substances suspended in a gaseous medium

PERIODICAL: Referativnyy zhurnal. Avtomatika i radioelektronika, no. 7, 1962, abstract 7-2-134 s (Hung. pat., cl. 216, 1-16, no. 147584, Oct. 1, 1960)

TEXT: The regulator is intended for automatically maintaining the voltage of the rectified direct current in the electric - [mechanical] filters at an optimum (maximum) value and for putting them in operation. It acts on the servomotor of the regulator of the step up transformer of the plant, by applying to it pulses from a special relay at determined time intervals (32 min.). The drive of the regulator accomplishes, in this connection, a single revolution, after which the voltage is automatically verified and, if required, the servomotor is again switched to give a gradual increase of voltage. If current overloads arise, another relay is energized, which causes the reverse rotation of the servomotor and a voltage decrease.

Card 1/2

Automatic voltage regulator for a ...

S/194/62/000/007/050/160
D295/D308

After a second relay has carried out the ventilation of the filter (by blowing air), the voltage again rises after a certain time to its optimum value. If the overload, i.e. short-circuit, is still there, another relay disconnects the regulating equipment and an alarm signal is produced at the same time. The circuit diagram of the regulator is given. [Abstracter's note: Complete translation.]

TITLE: Geophysical sketch map of Kazakhstan

SOURCE: International Geological Congress, 22d, New Delhi, 1964, Geologicheskiye rezul'taty prikladnoy geofiziki (Geological results of applied geophysics); doklady sovetskikh geologov, problema 2, Moscow, Izd-vo Nedra, 1965, 142-154

TOPIC TAGS: ~~geophysical geophysics~~, ~~geophysical mapping~~, ~~tectonics~~, ~~geophysical study~~

ABSTRACT: On the basis of regional geophysical and geological investigations (seismic, gravimetric, magnetoelectric), a composite geophysical sketch map of the physical field of Kazakhstan has been compiled. From this map, the major tectonic zones, deep structures, and geological structural zones are defined. Long zones representing high-field gradients in the gravitational and magnetic fields reflect deep geosutures, which seismic sounding data suggest are scarps in the M-discontinuity.

Card 1/2

ACC NR: AF601R174

Among the major structural zones of Kazakhstan defined are: 1) the Turgayskaya, 2) the Petropavlovskiy, 3) the Usgenkaya, 4) the Tekrauskaya, and 5) the Dzhalair-Kaymanskaya. Sections of metamorphism are also defined. In the tectonic depression zones, contour lines indicate the thickness of the sedimentary cover, overlying the folded massifs, or the depth of the older rock deposits. Blood sugar in the course of stomach and duodenal ulcers and of inflammatory diseases. Alexandre Goldschmied (2nd Med. Clin. Lublin, Poland). *Gastricenterologia* 73, 209-18 (1948) (in French). - Blood sugar levels were detd. at 4-5 min. intervals after intravenous administration of small amts. (8 g.) of glucose to subjects previously rendered hypoglycemic with 30 units of insulin. The difference between the blood sugar level in the hypoglycemic state and at 4 min. after glucose injection is called *glycemic thrust index*. The index is low in cases of stomach and duodenal ulcers, high in inflammatory diseases as pleuritis and cholecystitis. Ruth B. Pitt

The cupping glass test of Waldman (a greater percentage of monocytes in the first drop of blood from under the cupping glass than from the finger) applied so far chiefly in diseases of the reticulo-endothelial system, was used in cases of peptic ulcer. The test was positive in the majority of cases of peptic ulcer, while a positive test was rare in patients suffering from other diseases chosen at random. In healthy individuals the test was mostly negative. Further investigations will show which difference in monocyte count may be considered to be characteristic of peptic ulcer.

The influence of some drugs on the w�lywem 3rodzajem nasennym (no stat. znakow) zw. wypisem. Observations with regard to the influence of some drugs on the function of the liver. POLL. ARCHI. MED. WFWNET, 1955, 25, 3A (570-572); Tables 1.

A group of 143 patients with peptic ulcer, hypertension, diabetis, essential hypertension and neuroses were treated with propranolol-sleep (12-16 mg daily for 3 weeks). The drugs used were 0.3 g. of furosemide or 0.6 g. of phaeophytin or 1.5 g. of salazine and 1.0 g. of NaBr daily. Before and after treatment, the following tests were carried out: the Takata-Ara test, cadmium test, coagulation test, Van den Berg's direct and indirect reaction. The serum bilirubin level and the daily output of urinary urobilinogen were determined. In only 3 cases these tests had abnormal results after treatment, while the results were normal prior to treatment. In 35 cases (23%) abnormal liver function tests prior to treatment became normal or less abnormal after treatment. In the remaining patients the tests showed slight or no changes. It may be concluded that the drugs used had no unfavourable influence on the function of the liver.

4909. GOLDSCHMIED A., WIECKOWSKI W. and ZANDBERG H. Wspomnienia o
Kurze w chorobach nerek. Calciuria in kidney diseases. POL.
ARCH. MED. WEWNĘT. 1956, 26/8 (1201-1202)

Investigations on the alizarin test and the Sulkowitsch test showed that in persons affected with kidney diseases or with kidney impairment on the ground of other, e.g. contagious, diseases, the Ca level in 24-hour urine is markedly decreased almost in all cases; it amounts averagely to less than 3 mg./100 ml., while in persons not showing any kidney lesions this concentration amounts averagely to 10-25 mg./100 ml. The decrease of calcium concentration in the 24-hour urine usually appears parallel to the morphological changes in the urine; sometimes, however, the decrease is more distinct than these changes. The measurements of the Ca concentration were performed with the flame photometer, the alizarin test and the Sulkowitsch test. The alizarin test is extremely sensitive and its result depends on the Ca content in urine. By using the author's modification, which consists in the adequate dilution of the urine, on the basis of the result of the alizarin test the Ca level in urine may be determined with an accuracy in range of 2 mg./100 ml. A low Ca level in the urine suggests kidney impairment. Investigations were carried out on the clinical usefulness of determining the relation of Ca concentration in the blood to its concentration in the urine in kidney diseases.

Acta Psychiatrica, Vol 107, No 4, April 1998, pp 266-270.

(Abstract from the Hungarian summary) The experience gained in the course of quietuline treatment of 45 patients were reported. Attention is called mainly to the various localised symptoms, which are listed parallel to psychopathology, and the symptoms involving the nervous structures. When such symptoms develop, treatment with the drug must be suspended. All references are mentioned.

ABSTRACT: Regional geophysical surveys are conducted in Kazakhstan to divide the territory into tectonic regions, to study its plutonic structure, and to solve some problems of geophysical mapping. The results of these surveys will make it possible to establish structural belts and regions in which minerals are likely to be found. The basic material will be obtained from investigations of the magnetic and gravitational fields in combination with seismic studies. In the magnetic and gravitational fields, tectonic and plutonic seams are isolated which correspond to terraces in the

TITLE: Deep tectonic regionalization of Kazakhstan on the basis of geophysical data

SOURCE: Sovetskaya geologiya, no. 6, 1966, 34-47

TOPIC TAGS: tectonics, earth crust / Kazakhstan

ABSTRACT:

All available data are reviewed for the purpose of tectonic regionalization of Kazakhstan. In particular, observations along a series of profiles with a total length of 4,600 km were used. A merit of the article is that the authors describe exactly how all materials were used in regionalizing the area, and the study could be used as a model for regionalization of other areas on the basis of equivalent information. The graphic representation of the generalized data is particularly clear and easily interpreted. Fig. 2 shows analysis of the gravity field over columns of the earth's crust of identical thickness in different areas; Fig. 2 effectively shows the generalized characteristics of the deep structure of the principal tectonic blocks of Kazakhstan; Fig. 4 is a composite map of the distribution of deep faults and areas of intrusive magmatism in Kazakhstan; Fig. 5 is a map of the tectonic regionalization on the basis of geological-geophysical data. Orig. art. has: 5 figures. [JPRS: 38,460]

TITLE: Abyssal tectonic zoning of the territory of Kazakhstan according to geophysical data

SOURCE: Ref. zh. Geofizika, Abs. 6G32

REF SOURCE: Sb. Geofiz. issled. v Kazakhstane. Alma-Ata, Kazakhstan, 1965, 9-27

TOPIC TAGS: geophysics, geology, geographic location, tectonics, earth crust

ABSTRACT: A description is given of the sequential development of the geological interpretation of geophysical data, from factual material to maps of the abyssal structure of the earth's crust and the typification of its individual blocks, the quantitative characteristics of the abyssal fractures, and the development of a system of geotectonic zoning. It is shown that the Moho discontinuity (M) was built according to graphoanalytic correlation dependencies between zonal anomalies and the delineation of the M boundary, and studied according to deep seismic

Card 1/3

UDC: 550.311(574)

ACC NR: AR6032146

sounding and deep seismic profiling. An isodepth system of the "basalt" and "diorite" surface layers was built. Knowledge of the delineation of the M surface makes it possible to construct systems of isopachous lines of the "basalt" layer. A simultaneous analysis of the Moho and Conrad discontinuities provides data for the definition of the structure of the earth's crust in various regions. The coefficient of basalt saturation (K_b), equal to the relation between the thickness of the "basalt" layer and the general thickness of the earth's crust, is used to define individual blocks. Earth-crust blocks of similar structure are defined by similar coefficient values (0.77 and 0.67 for the Akbastau and Kokchetav massifs, respectively, 0.38 for the Russian platform, etc.) The simultaneous analysis of the definition of the core of interfaces makes it possible to suppose that zonal anomalies can be caused by a possible heterogeneity in the density of the mantle. Maps of anomalous magnetic fields, gamma fields, etc., and geological information are brought out to study the structure of the "granite" layer aside from the gravitation field. The authors synthesize the data obtained and work out regional tectonic delimitations of areas of intrusive magnetism, abyssal fractures, deep-seated faults, preorogenic synclinales, foredeeps, intermountain depressions, superimposed troughs, etc. The deep faults are divided into 4 groups: those reflected in the M surface; those not reflected in it, but controlled by ultrabasite belts; those manifested in the "basalt" layer; and those dying out in the "granite"

Card 2/3

ACC NR: AR6032146

and "diorite" layers. The structure of the basic geotectonic blocks of the Kazakhstan-Caspian tectonic syncline, group of ancient rigid folding structures, including the Kokchetav, Balkhash, Akbastau, Slavgorod, and Aral blocks, and areas of Caledonian and Hercynian folding. It is shown that the faults of the first group are concentrated mainly in eastern Kazakhstan; the displacement of blocks contacting under it reaches 5—7 km, while the extension reaches 500—1000 km. The faults of the second group are oriented mainly in the north-east and meridional directions. They are widespread, as are those of the third and fourth groups. The complex tectonic-formation block structure of Kazakhstan is caused by the coincidence of the main abyssal faults. The bibliography contains 28 entries.

TITLE: Phenols derived from wood processing as raw materials for binders for
wood chip panels

SOURCE: Gidroliznaya i lesokhimicheskaya promyshlennost', no. 5, 1965, 7

TOPIC TAGS: wood chemical product, phenol, pyrolysis, resin, structure panel

ABSTRACT: Vapor-phase pyrolysis of phenolic components of resins obtained from thermolysis of wood pulp is recommended as a process for the preparation of free phenols used as a basis for wood chip binders. The resins were subjected to a combination of distillation and vapor-phase pyrolysis, using the following mixture of products: phenols 89.2, neutral materials 5.2, acids 1.8, water 3.8%. The binders were prepared by mixing this material (100 parts) with 34% formaldehyde (80-100 parts), and 50% KOH or NaOH (4-12 parts) at 40-50°C for 1-2 hours, until the viscosity of 50-60° (according to FE-36) was reached. The density of the product was 1.12-1.14, and its polymerization rate at 150°C was 50-70 sec.

The dried and sieved shavings from wood processing plants were mixed with phenolic

Card 1/2

L 63862-65

ACCESSION NR: AP5020385

binders. They were then shaped and pressed into panels 10, 15 and 30 mm thick, by the process developed at the wood chip division of the Pyatigorskii zhelezobetonykh izdeliy i konstruktsii tresta "Kavminpromstroy" (Pyatigorskii Plant for Reinforced Concrete). The bending strength of panels made with phenolic

binders was 146 kg/cm² as compared with 88 kg/cm² shown by panels made with urea-formaldehyde resins. No special plant equipment was necessary in changing to the new type of binding compound. The wood chip panels so produced have no specific odor and are stronger and more water resistant. Orig. art. has 1 italic.

"Two Types of Periodically Functioning Pulmonary
Pleural Fistula and Closure Methods of Treating
Them," A. I. Gol'dshteyn, Cand Med Sci, Dist Tubercu-
losis Sanatorium PribVO, 3 pp

"Problemy Tuberkuleza" No 6

Presents six case histories. Two types of pulmonary
pleural fistula are: (1) functioning from pleural
cavity to lung, and (2) functioning from lung to
pleural cavity. As a rule, periodically occurring
fistulas function in one direction only. Treatment
for (1) differs radically from that for (2).
